DESCRIPTORS: *Zinc, *Corrosion, Electrochemistry,
Corrosion research, Water.

The electrochemical and corrosion kinetic behavior of
zinc in water of different kinds was investigated be-
tween 20°C and 95°C. An increase of potential of Zn was
observed at 80°C in the tap water, feed water and dis-
tilled water, which can be explained by the change in
the characteristics of the corrosion products and by the
change in the depolarization mechanism of the cathodic
places. In the synthetic water the potential increase
has not been observed. Different reaction mechanisms
